Apple products make sound financial sense for your business.

Durable by design
You count on your device day after day. So we design our products with durable materials, support them with ongoing operating system updates, and make them easy to get repaired if anything happens.

Apple products are built to last. For example, iPhone 11 Pro and iPhone 11 Pro Max have a rating of IP68 for dust and water resistance under IEC standard 60529, which means the devices can withstand being submerged to a depth of 4 meters for up to 30 minutes.

In our Reliability Testing Lab, we amplify real-world conditions to enhance the durability of our designs. We test the ability to withstand mechanical stresses, such as a sudden impact with a hard surface. In climate tests, we test our devices in extreme heat and cold, dry and humid conditions, and intense sun exposure. Our chemical sensitivity tests evaluate the ability of devices to stand up to accidental spills like coffee, soda, sunscreen, or ketchup. We often go beyond international standards, and sometimes even create our own.

With these tests, we intentionally push our products beyond their limits so we can study what happens. We then use state-of-the-art equipment, such as CT scanners and electron microscopes, to thoroughly understand the impact to the microstructure. This information flows back to our designers and engineers to enable further durability improvements. We repeat this cycle through our product development process until our products meet our rigorous performance standards.
Simple software updates
As well as being durable, Apple devices are designed to be upgradable. And because those upgrades are available across multiple generations of products, more users are able to take advantage of new software features.

The software update process itself is simple and efficient, resulting in greater adoption compared to other platforms. As of August 6, 2019, 90 percent of all devices introduced in the previous 4 years were using the latest version of iOS when accessing the App Store.

As well as being great for users, this operating system consistency also makes Apple devices far easier to manage for IT. Having the same operating system in use across an entire deployment simplifies hardware and software support, app development, integration, security updates, and more.

A high residual value
The combination of highly durable hardware, a worldwide network of repair providers, and simple software updates means that Apple products retain significant value over their lifecycle, making them more affordable. Unlike other devices that often end up being unused or given away at the end of their lifecycle, the high residual value of Apple devices means your existing products may be used as trade-ins when you come to upgrade.

Using innovative financing options from Apple Financial Services, you can even account for the high residual value of Apple devices up front, keeping your costs low from day one even without trading in existing products.

Intuitive to use, simple to deploy
Apple products are intuitive to use, making it easy for business users to do more with less help, further reducing costs. According to a recent study, Mac users open 50 percent fewer support tickets, and each ticket costs 25 percent less to resolve. The same study found that, on a per device basis, Mac costs $628.31 less than comparable PCs when considering 3-year support and operational costs.

It’s also easy to deploy and manage Apple devices, even at the largest scale. Every iPhone, iPad, Mac, and Apple TV can be set up and configured automatically—eliminating the need for IT to handle each device individually. With Apple Business Manager, devices can be distributed directly to employees and used right out of the box, leaving manual configuration behind forever and further reducing costs. So now you can give your employees the tools that make them productive in a way that is cost-efficient for your business.
